Chapter 1: Modern Design Tokens & Visual Hierarchy

Building consistent typography, spacing, and elevation systems

A design system is the single source of truth connecting product design and frontend engineering. By standardizing spacing on an 8pt grid and defining semantic color tokens, design velocity triples.

Key Takeaways & Best Practices:

- Never use arbitrary hex values in production components.
- Maintain minimum 4.5:1 contrast ratios for WCAG AA compliance.
- Use micro-animations with cubic-bezier easing to reward user interactions.
